(URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes inplemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/axpected third position G + C. GAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg., 9tg., or ttg) which is preceded by an upstream ribosome codon): If this cannot be identified we choose the most upstream codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /codon_start=1

This DNA sequence comprises Mycobacterium bovis BCG deletion
sequence BCGdelta3. A specific genetic deletion of this region
ceaults in an avivalence phenotype of the mycobacterium. 2 other
celetion regions (see AA713535 and AA733536) have also been detected.
Identification involved screening a BCG cosmid library with a
redicible deprobe obtained following DNA subtraction between
cridicabeled probe obtained following DNA subtraction between
virulent Mycobacterium tuberculosis H37Rv and avirulent BCG.
The deletions provide useful markers for the identification of an
avirulent, or a virulent, mycobacterial phenotype. Determination
of avirulence requires the detection of the presence or absence of
the deletion; the deletions are detected either by detecting the
presence or absence of deletion junctions (see AA733538-46), or by
detecting the presence or absence of the sequences contained within
the deletion. Deletion polypeptides are used as components of
Detecting markers for avirulence in Mycobacterium - used in production of vaccines against bacterial infection, and to detect

                                                                                                                                     The isolated DNA molecule of the invention confers on M. tuberculosis an ability to enter cells and to survive within macrophages. It encodes a polypeptide having a mol. wt. of about 50-55 kDa, pref. 52 kDa. The AA sequence represents a highly hydrophilic protein with a hydroj hobic region at its carboxy terminus. It could be a secreted protein, a cytoplasmic protein, or a surface protein with list carboxy terminus attached to the outer membrane of the organism. The deduced AA sequence is in AAR71931.

A DNA molecule (AAT3465b) confers on Mycobacterium tuberculosis an ability to enter mammalian cells and to survive within macrophages. The encoded protein sequence is given in AAM02301. The DNA was obtd. by ligating M. tuberculosis genomic DNA fragments into pBluescript II vector and screening recombinant E. coll strains for HeLa cellminsus or clones. The DNA includes 2 separate coding regions (see also AAT34657-58) confine for the cell entry (AAM02302) and macrophage survival (AAM02301) proteins. He can be used to produce the cellular uptake proteins used as vaccines of to facilitate uptake of other

The protein can be used in a vaccine to prevent M. tuberculosis infection, and provide for the uptake in cells of, e.g. antibiotics, DNA fragments or anti-neoplastic agents. Antibodies raised against it can be used to treat mammals already exposed to

It can be incorporated into a vector and used for prodn. of recombinant macrophage survival protein, which is useful in vaccines or for facilitating uptake of other materials, e.g. therapeutic genes, into mammalian cells. A second DNA molecule (AAR13657) codes for a protein (AAM0302) that confers on M. tuberculosis the ability to enter mammalian cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Streptomyces avermitilis, avermectin aglycon synthase; biosynthesis, multifunctional enzyme; polyketide; avermectin; veterinary drug;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence encodes a Mycobacterium tuberculosis cellular uptake protein fragment, which conters on M. tuberculosis an ability to survive within macrophages.

The protein can be used in a vaccine to prevent M. tuberculosis infection, and provide for the uptake in cells of, e.g. antibiotics, DNA fragments or anti-reoplastic agents. Antibodies raised against it can be used to Lreat mammals already exposed to M. tuberculosis, to induce a passive immunity and prevent disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PHILIPPER CONTROL TO THE PRODUCT OF THE PHILIPPER OF THE

Also described are: (1) polypeptides encoded by all or part of the DNA; (2) expression vectors containing the DNA; (3) host cells transformed by the fectors; (4) preparation of the polypeptides by culture of the transformants; (5) preparation of avermectin aglycon or its derivatives by culture of transformed avermectin-producing microorganisms; and (6) oligonucleotides of 5-60 bases in length containing sense or antisense sequences from the avermectin aglycon synthase DNA. The enzymes are useful for the production of modified forms of avermectin and of the intermediates in its biosynthesis, for use as drugs, veterinary drugs and agrochemicals.

The present invention describes a library of human polynucleotides comprising the sequences given in AAZ12512 to AAZ17779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynuclectide sequences given in AAZ12312 to AAZ17779. The polynuclectides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profilling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides and be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polynucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer). "he polynucleotides of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for

                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of DNA encoding the first 2 modules of the avermectin polyketide synthase (PKS) of Streptomyces avermitilis. The invention relates to nucleic acids encoding a Type I PKS such as avermectin in which a polylinker with multiple restriction sites replaces or I more PKS genes encoding enzymes associated with reduction. Novel PKS are provided in which is which the reductive loop in a selected module of the Type I PKS is replaced with the equivalent segment from the same or different PKS gene cluster or by a mutated or synthetic segment. Vectors and host cells, and methods for producing novel polyketides by culturing host cells are claimed. The polyketides by culturing host cells are claimed. The polyketides obtained are useful as antibiotics and insecticides. Fermentation products

The prescut sequence represents an NheII-XhoII fragment that encodes module 8 of te FK-520 polyketide synthase (PKS) gene cluster with the endoqueous acyltransferase (AT) domain replaced by the AT domain of endogenous acyltransferase (AT) domain replaced by the AT domain of module 12 of the rapamycin PKS (which is specific for malonyl CoA).

FK-506 is a potent immunosuppressants, and acts through initial formation of an intermediate complex with protein immunophilins known as FK-506 binding proteins. The nucleic acids are used for producing polyketide compounds. The polyketide compounds can be used as immunosuppressants to prevent or treat transplant rejection, graft-versus-host disease or uveitis. They can also be used for treating e.g. alopecia universalis, autoimmune chronic active hepatitis, inflammatory bowel disease, multiple sclerosis, primary biliary cirrhosis, or scleroderma. They also have neurotrophic activity and can be used to promote neurine outgrowth in NGF-treated PC12 cells and in sensory neuronal cultures, and in intact animals, they promote regrowth of damaged facial and continued repair lesioned serotonin and dopamine neurons in the brain. They can also be used for treating e.g. Parkinson's disease, altoke, traumatic spinal cord and brain injury, or peripheral neuropathies. They can also be used in agricultural and vertical vertica

```
The present sequence represents an AvrII-XhoII fragment that encodes module 8 of te FK-520 polyketide synthase (PKS) gene cluster with the endogenous acyltransferase (AT) domain replaced by the AT domain of module 12 of the rapamycin PKS (which is specific for malonyl units). FK-506 is a potent immunosuppressants, and acts through intial formation of an intermediate complex with protein immunophilins known as FK-506 binding proteins. The nucleic acids are used for producing polyketide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated polyketide synthase nucleic acid and polyketide compounds, useful for treating e.g. transplant rejection, uveitis, multiple sclerosis, Alzheimer's disease, Parkinson's disease, stroke, or perlipheral neuropathy
                                                                               immunophilin; FK-506 binding protein; polyketide compound; uveitis; transplant rejection; qraft-versus-host disease; alopecia universalis; autoimmune chronic active hepatitis; inflammatory bowel disease; multiple sclerosis; primary biliary cirrhosis; scleroderma; neurite outgrowth; nerve regrowth; Parkinson's disease; Alzheimer's disease; stroke; traumatic spinal cord; brain injury; peripheral neuropathy; ss.

be used as immunosuppressants to
                             uveitis. They can also be used for treating e.g. alopecia universalis, autoimmune chronic active hepatitis, inflammatory bowel disease, multiple sclerosis, primary biliary cirrhosis, or scleroderma. They also have neurotrophic activity and can be used to promote neurite outgrowth in NGF-treated POI2 cells and in sensory neuronal cultures, and in intact animals, they promote regrowth of damaged facial and sciatic nerves, and repair lesioned serotonin and dopamine neurons in the brain. They can also be used for treating e.g. Parkinson's disease, Alzheimer's disease, stroke, traumatic spinal cord and brain injury, or peripheral neuropathies. They can also be used in agricultural and

module 8 of the FK-520 polyketide synthase (PKS) gene cluster with the cudogenous acyltranslerase (AT) domain replaced by the AT domain of module 13 of the rapamycin PKS (which is specific for methylmalonyl CoA). FK-506 is a potent immunosuppressure, and acts through initial formation of an intermediate complex with protein immunophilins known as FK-506 binding proteins. The moticie acids are used for producino polyketide compounds can be used as immunosuppressarts to prevent or treat transplant rejection, graft-versus-host disease or uveilts. They can also be used to treating e.g. alopecia universalis, autoimmune chronic active hepatitis, inflammatory bowel disease.

Multiple sclerosis, primary biliary cirrhosis, or scleroderma. They also have neurotrophic activity and can be used to promote neurine cutyprowth in NGF-treated PC12 cells and in sensory neuronal cultures, and in intact animals, they promote regrowth of damaged facial and scitc nerves, and repair lesioned serotonin and dopamine neurons in the brain. They can also be used for treating e.g. Parkinson's disease, Alzheiner's disease, stroke, traumatic spinal cord and brain injury, or peripheral neuropathies. They can also be used in agricultural and

module 8 of to FK-520 polyketide synthase (PKS) gene cluster with the endogenous acyltransferase (AT) domain replaced by the AT domain of module 13 of the rapamycin PKS (which is specific for methylmalonyl CoA). FK-506 is a potent immunosuppressants, and acts through initial formation of an intermediate complex with protein immunophilins known as FK-506 binding proteins. The nucleic acids are used for producing polyketide compounds can be used as immunosuppressants to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and in intect animals, they promote regrowth of damaged facial and sciatic nerves, and repair lesioned serotonin and dopamine neurons in the brain. They can also be used for treating e.g. parkinson's disease, Alzheimer's disease, stroke, traumatic spinal cord and brain injury, or peripheral neuropathies. They can also be used in agricultural and

They can also be used for treating e.g. alopecia universalis, autoimmune chronic active hepatitis, inflammatory bowel disease, multiple sclerosis, primary biliary cirrhosis, or scleroderma. They also have neurotrophic activity and can be used to promote neurite outgrowth in NGF-treated PC12 cells and in sensory neuronal cultures,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  4129

The present sequence represents DNA which encodes avermectin aglycon synthase proteins. Also described are: (1) polypeptides encoded by all or part of the DNA; (2) expression vectors containing the DNA; (3) host cells transformed by the vectors; (4) preparation of the polypeptides by culture of the transformants; (5) preparation of avermectin aglycon or its derivatives by culture of transformed overmectin-producing microorganisms; and (6) oligonucleotides of 5-60 bases in length containing sense or antisense sequences from the avermectin aglycon synthase DNA. The enzymes are useful for the production of modified forms of avermectin and of the intermediates in its blosynthesis, for use as drugs, veterinary drugs and agrochemicals.
                                                                                                                    Avermectin aglycone synthase DNA and proteins encoded by all or part it for the production of avermectin and its derivatives for drug and

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              tgggttcggggtagccgcgaa......cgacgacaaacccgattgac 1393

Patent No. 6294328
GENERAL INFORMATION:
APPLICANT: FLEISCHMAN, Robert D.
APPLICANT: FRASER, Claire M.
APPLICANT: FRASER, Claire M.
APPLICANT: WHITE, Owen R.
TITLE OF INVENTION: TUBERCULOSIS
TITLE OF INVENTION: DNA SEQUENCES FOR STRAIN ANALYSIS IN MYCOBACTERIUM
TITLE OF INVENTION: DNA SEQUENCES.
TITLE OF INVENTION: DNA SEQUENCES.
TITLE OF INVENTION: DNA SEQUENCES.
TITLE OF INVENTION: 1996-2007.00
CURRENT APPLICATION NUMBER: US/09/103,840A
NUMBER OF SEQ ID NOS: 2
SOFTWARE: PATENTIN Ver. 2.1
SEQ ID NO 2
